class07

```
url <- "https://tinyurl.com/UK-foods"
x <- read.csv(url)</pre>
```

Q1. How many rows and columns are in your new data frame named x? What R functions could you use to answer this questions?

```
nrow(x) # with ncol

[1] 17

ncol(x) # with nrow

[1] 5

dim(x) # OR this alone

[1] 17 5
```

We can use head(x) to preview the first 6 rows.

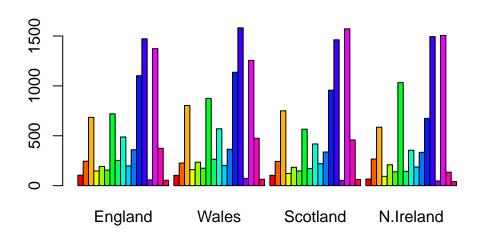

```
# fixing row-names
# rownames(x) <- x[,1]
# x <- x[,-1]
# head(x)
# dim(x)
# we could also read the data file again, but set row.names argument of read.csv() to be t
x<-read.csv(url, row.names=1)
head(x)</pre>
```

	England	Wales	Scotland	N.Ireland
Cheese	105	103	103	66
Carcass_meat	245	227	242	267
Other_meat	685	803	750	586
Fish	147	160	122	93
Fats_and_oils	193	235	184	209
Sugars	156	175	147	139

Q2. Which approach to solving the 'row-names problem' mentioned above do you prefer and why? Is one approach more robust than another under certain circumstances?

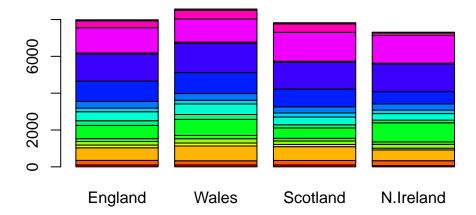

I prefer the alternative approach of reading with the row.names argument set to 1 in read.csv(). It is more legible and requires less code. Also, repeating the first approach will begin to produce errors since then more columns are being removed from x and we begin to lose data. The read.csv() method is better able to be run many times without producing errors.

```
barplot(as.matrix(x), beside=T, col=rainbow(nrow(x)))
```

Q3. Changing what optional argument in the above barplot() function results in the following plot?

```
# the beside argument, which changes from true (T) to false (F) barplot(as.matrix(x), beside=F, col=rainbow(nrow(x)))
```

Q5. Generating all pairwise plots may help somewhat. Can you make sense of the following code and resulting figure? What does it mean if a given point lies on the diagonal for a given plot?

```
pairs(x, col=rainbow(10), pch=16)
```

Somewhat, although it's hard to read. If a given point lies on the line, it means that both countries consume about equal amounts in grams of that food, on average.

Q6. What is the main differences between N. Ireland and the other countries of the UK in terms of this data-set?

N. Ireland tends to consume less cheese, fish, fresh fruit, and alcoholic drinks but more fresh potatoes than the other countries in the data set.

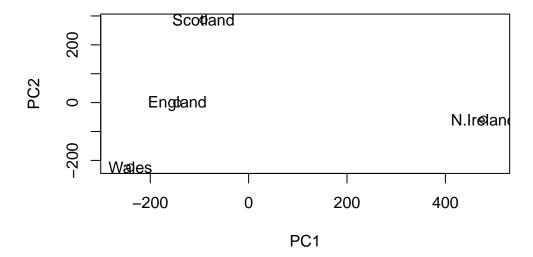

```
pca <- prcomp(t(x))
summary(pca)</pre>
```

Importance of components:

	PC1	PC2	PC3	PC4
Standard deviation	324.1502	212.7478	73.87622	2.921e-14
Proportion of Variance	0.6744	0.2905	0.03503	0.000e+00
Cumulative Proportion	0.6744	0.9650	1.00000	1.000e+00

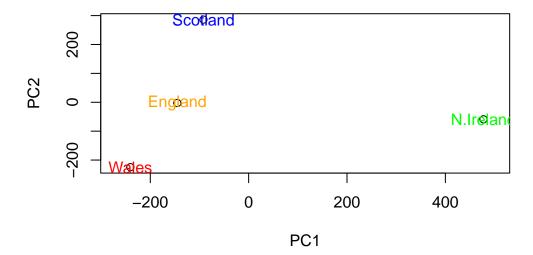

Q7. Complete the code below to generate a plot of PC1 vs PC2. The second line adds text labels over the data points.

```
# Plot PC1 vs PC2
plot(pca$x[,1], pca$x[,2], xlab="PC1", ylab="PC2", xlim=c(-270,500))
text(pca$x[,1], pca$x[,2], colnames(x))
```

Q8. Customize your plot so that the colors of the country names match the colors in our UK and Ireland map and table at start of this document.

```
# Plot PC1 vs PC2
plot(pca$x[,1], pca$x[,2], xlab="PC1", ylab="PC2", xlim=c(-270,500))
text(pca$x[,1], pca$x[,2], colnames(x), col=c("orange", "red", "blue", "green"))
```

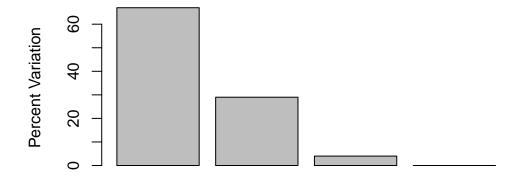

```
v <- round( pca\$sdev^2/sum(pca\$sdev^2) * 100 ) #how much variation in the original data do v
```

[1] 67 29 4 0

```
## or the second row here...
z <- summary(pca)
z$importance</pre>
```

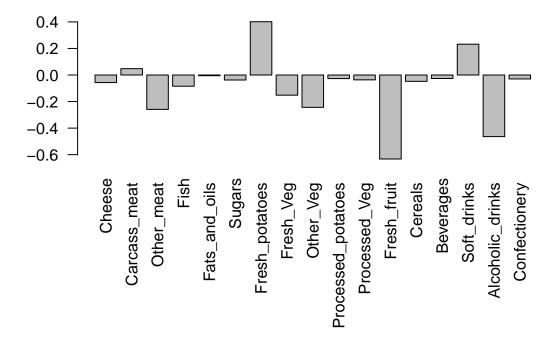

#This information can be summarized in a plot of the variances (eigenvalues) with respect barplot(v, xlab="Principal Component", ylab="Percent Variation")

Principal Component

 ${\it loading \ scores = influence \ of \ each \ original \ variable \ upon \ principal \ components}$

```
## Lets focus on PC1 as it accounts for > 90% of variance
par(mar=c(10, 3, 0.35, 0))
barplot( pca$rotation[,1], las=2)
```

Q9: Generate a similar 'loadings plot' for PC2. What two food groups feature prominently and what does PC2 mainly tell us about?

```
par(mar=c(10, 3, 0.35, 0))
barplot( pca$rotation[,2], las=2)
```

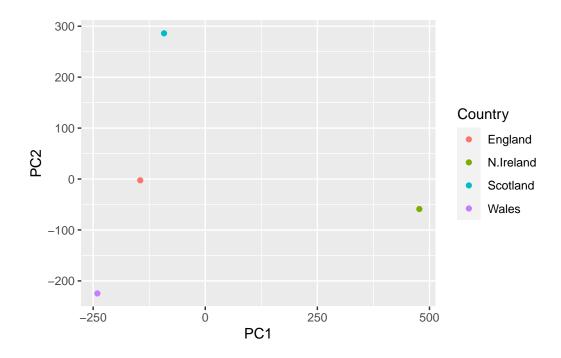

Fresh potatoes (negative) and soft drinks (positive) feature prominently. PC2 tells us more about where the variance in the data comes from, accounting for about 29% in addition to PC1 (67%). We see that fresh potatoes continue to be a significant feature in both PC1 and 2, indicating how strong of an influence they are in producing variation in this data.

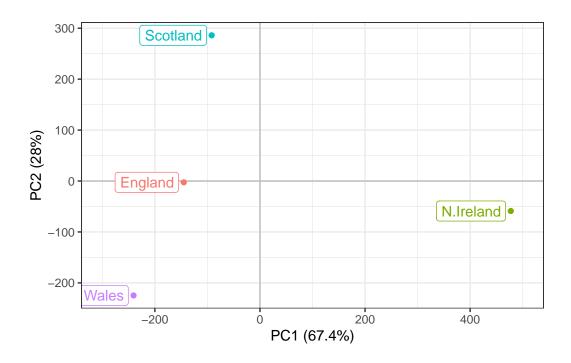

```
library(ggplot2) # using ggplot2 now

df <- as.data.frame(pca$x)
df_lab <- tibble::rownames_to_column(df, "Country")

# Our first basic plot
ggplot(df_lab) +
   aes(PC1, PC2, col=Country) +
   geom_point()</pre>
```

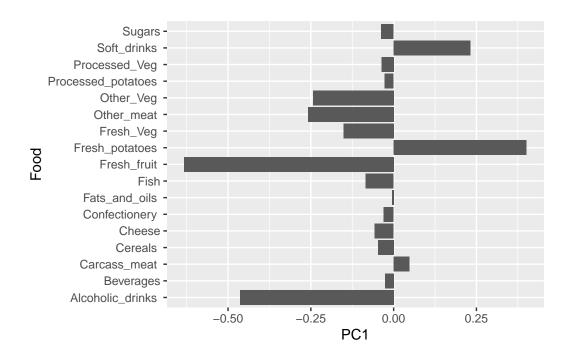

```
# make it look nicer
ggplot(df_lab) +
  aes(PC1, PC2, col=Country, label=Country) +
  geom_hline(yintercept = 0, col="gray") +
  geom_vline(xintercept = 0, col="gray") +
  geom_point(show.legend = FALSE) +
  geom_label(hjust=1, nudge_x = -10, show.legend = FALSE) +
  expand_limits(x = c(-300,500)) +
  xlab("PC1 (67.4%)") +
  ylab("PC2 (28%)") +
  theme_bw()
```

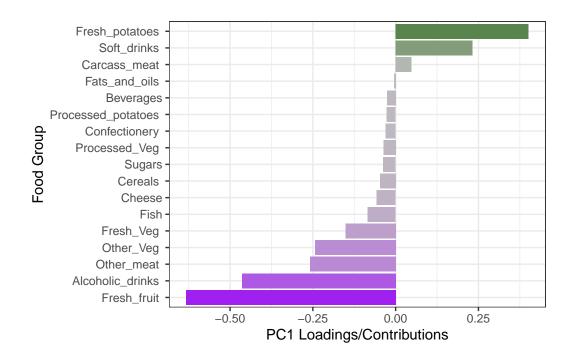

```
# now doing the same for pca$rotation (loadings/PC contributions figures)
ld <- as.data.frame(pca$rotation)
ld_lab <- tibble::rownames_to_column(ld, "Food")

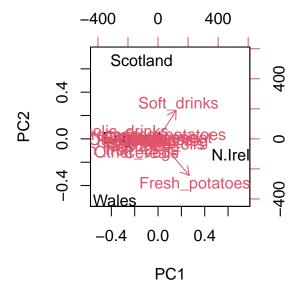

ggplot(ld_lab) +
  aes(PC1, Food) +
  geom_col()</pre>
```

```
# funky with the features (reordering, colors, theme)
ggplot(ld_lab) +
  aes(PC1, reorder(Food, PC1), bg=PC1) +
  geom_col() +
  xlab("PC1 Loadings/Contributions") +
  ylab("Food Group") +
  scale_fill_gradient2(low="purple", mid="gray", high="darkgreen", guide=NULL) +
  theme_bw()
```

The inbuilt biplot() can be useful for small datasets
biplot(pca)

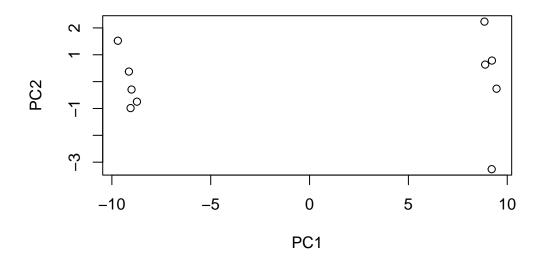

RNA seq PCA

```
